Reasons For Allowance

The present invention is directed to a premix burner apparatus and method, as well as a gas turbine combination including the premix burner. The claims all require an annular air channel having a fuel inlet along with a profiling means or method step. The profiling means operates in the air channel upstream of the fuel inlet so as to create a perpendicular (radial) variation in the air mass flow thereby causing a radial variation in fuel density downstream of the fuel inlet. Premix burners having a flow profile exhibiting a radial variation in fuel density are known in the art as indicated, for example, by the three patents cited on the attached Form PTO-892. Note profiles 8, 12 and 26 shown respectively in Figure 1 of Althaus, Figure 1 of Doebling et al and Figure 2 of Koenig et al. (Althaus actually shows a temperature profile but that is indicative of fuel density.) Each of the prior art systems establishes a variation in fuel density by its specific arrangement of fuel nozzles. Unlike the claimed invention, however, none of the prior art systems create a radial variation in fuel density using profiling means to establish a radial variation in air mass flow. The claimed invention is therefore considered patentable over the prior art.
